

Share your low-fidelity prototype

You just built a low-fidelity prototype for your mobile app. Now, share your work with your peers in this discussion and comment on at least two other posts.

To share your prototype in Adobe XD, open your project file and switch to the **Share** tab in the top-left corner. In the panel on the right side, select **Design Review** from the **View Setting** menu and **Anyone with the link** from the **Link Access** menu. Click **Create Link** and copy the URL link. This is what you will share with your peers.

To share your prototype in Figma, open your project file and click the **Share** button in the top-right corner. In the pop-up box, select **Anyone with the link** and **can view** as the share settings. Click **Copy link** and share this link with your peers.

In your responses to at least two of your peers, consider and discuss how the low-fidelity prototypes you review demonstrate the following:

Connect all the screens required to complete the primary user flow

Allow users to move backward and forwards

Include navigational cues that highlight elements that can be interacted with

Contain a user flow with an end that sends users back to the home screen after completion
