Optional - Start creating website mockups in Figma

If you're using Figma instead of Adobe XD to design a responsive website in this course, you can follow steps similar to Dave's demonstration video to create your mockups. While the design tool is a little different, the process is still the same. For example, you'll want to create a navigation bar with the organization's logo at the top of the website home page. And you'll likely want to include a hero image of some kind.

Remember to use tools like **Shape**, represented by the square icon, and **Text**, represented by the T icon, to add elements to your designs. These two tools are outlined in red in the image below.

If you'd like to learn more about creating website mockups in Figma, revisit the previous course of the certificate program, [Create High-Fidelity Designs and Prototypes in Figma](#) [↗], where the instructor, Kunal, demonstrates how to build mockups of an app throughout the course. Each week of the course introduces new elements to include in your mockups.
